Process & Decision Documentation

Project/Assignment Decisions

Side Quests and A4 (Individual Work)

Key Decision:

- For this week's side quest, I sourced a free sprite sheet, tile set, and sound effects online. A key part of this process was selecting assets that matched the tone and mechanics of the game while remaining compatible with our existing structure.
    - Which sprite sheet best fits the player, leaf, and enemy roles

Role-Based Process Evidence

Name: Jenny South

Role(s): Designer + Developer (Individual Side Quest)

- Replaced the player, leaf, and enemy visuals using a new sprite sheet
- Updated the level's visual identity using a new tile set
- Integrated sound effects for:
    - Jumping
    - Attacking
    - Taking damage
    - Collecting objects
- Implemented a looping background track

Goal of Work Session

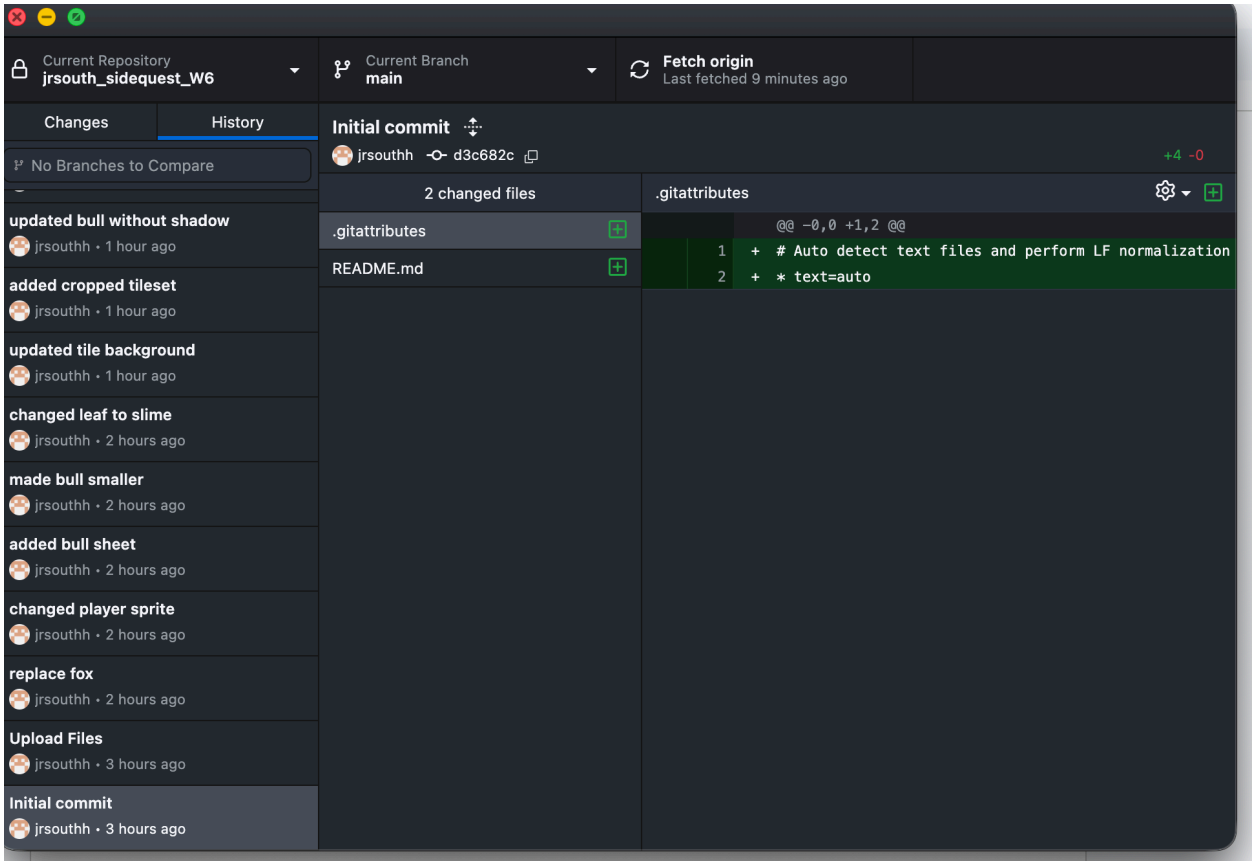
I wanted to prove that I could:

- Properly integrate external sprite sheets into the existing character system
- Use tile sets
- Implement sound design
- Follow documentation requirements (README credits)

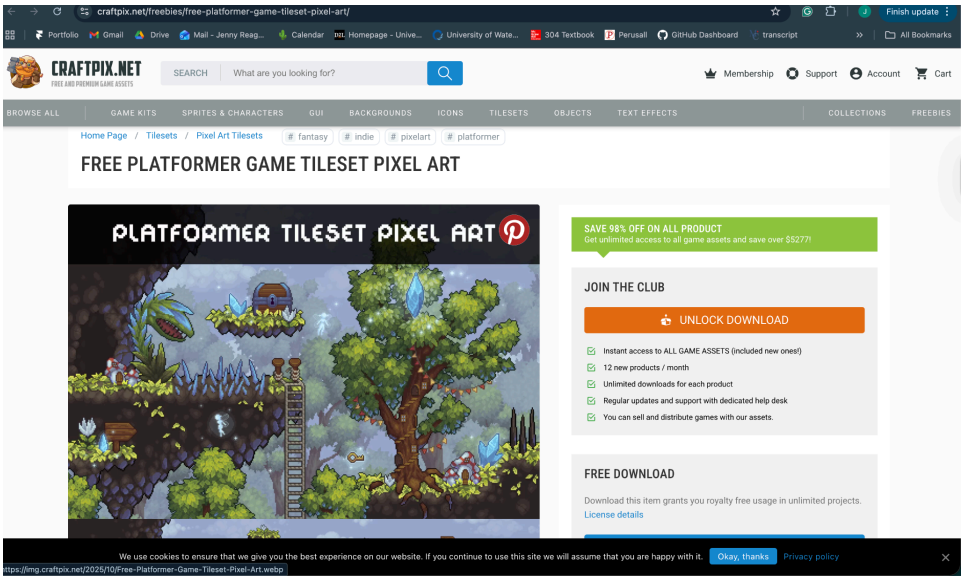
Tools, Resources, or Inputs Used

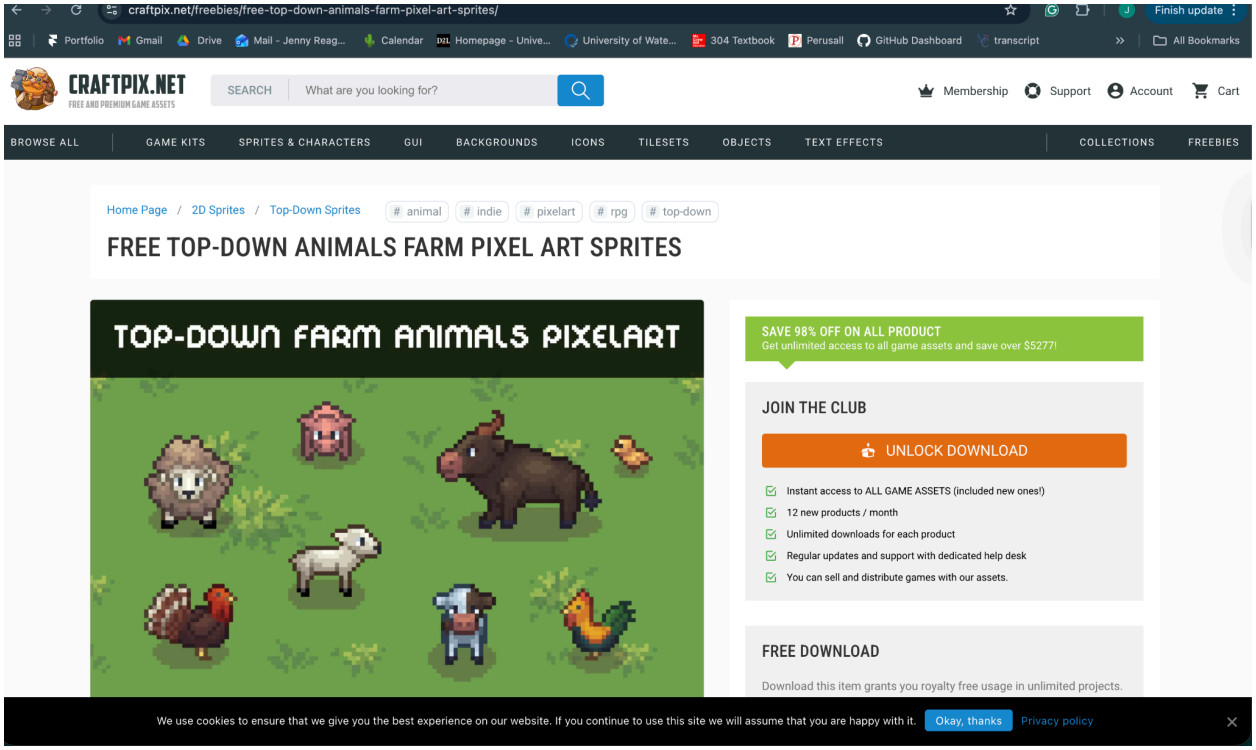
- p5.js (movement/animation/interaction)
- Visual Studio Code
- Online Websites to get assets
- Claude
- Example 04 code (week 06)

Process Evidence:



Went through the process of adding the tileset, uploading files and sprites





Sourced assets

GenAI Documentation

Date Used: March 2, 2026

Tool Disclosure: Claude

Purpose of Use: To diagnose why my audio files were not loading/playing in my p5.js project.

Summary of Interaction: I asked Claude why my audio was not loading. I shared my index.html and sketch.js setup and used the response to identify likely causes. Claude helped me narrow the issue to file path/location problems (audio files being stored in assets/ while index.html referenced them from the project root), plus basic troubleshooting checks like confirming exact file names/capitalization and ensuring I was running with a local server (Live Server). Claude also explained that audio playback may require user interaction due to browser autoplay policies

Human Decision Point(s): All design and implementation decisions were made by me. I decided:

- Where to store the audio files (assets folder structure)
- Whether to reference audio in index.html and manage playback through my own game logic
- Which fix to apply (updating src paths) and how to test it

Claude was only used to help identify the cause of the loading issue; it did not generate my game mechanics, level design, or structure.

Integrity & Verification Note: All changes were manually implemented and tested by me in the browser using Live Server. I verified the fix by:

- Updating audio src paths to match file locations
- Reloading the project and testing playback behaviour
- Confirming audio would play once the game received user input (consistent with browser restrictions)

Scope of GenAI Use: GenAI was used only for troubleshooting: identifying why audio was not loading and confirming common causes (pathing, file names, and browser playback restrictions).

Limitations or Misfires: Initially, audio appeared “not working” because files were referenced from the wrong folder. After correcting paths, sound still seemed inconsistent until I confirmed the browser required user interaction to start playback.

Summary of Process (Human + Tool)

I integrated audio into the project and encountered a loading issue. I used Claude to help diagnose the cause. After identifying that my audio files were located in assets/ while my HTML referenced them from the root folder, I corrected the file paths and tested again using Live Server. I confirmed audio loaded and played as expected once triggered properly.

Decision Points & Trade-offs

I organized all audio files inside an assets/ folder to keep the project structured, which required updating file paths correctly. I chose to work within browser audio restrictions rather than bypass them, ensuring sounds were triggered intentionally through gameplay events.

Verification & Judgement

Using Live Server, I confirmed that all audio files loaded correctly (no 404 errors) and that sounds played only when triggered. I refreshed and replayed the game multiple times to ensure consistent behaviour.

Limitations, Dead Ends, or Open Questions

The main issue was incorrect file path references. Even after fixing them, browser autoplay restrictions initially made audio seem broken. This highlighted the importance of proper file structure and understanding browser media policies.
